Developing Project User Stories

The first step of the project will be for your team to develop a set of user stories. We have prepared some **example projects (https://q.utoronto.ca/courses/444184/pages/project-domains-and-sample-user-stories)** with user stories that would be appropriately scoped for the CSC207 team project. For the project, **each member of your team will be required to implement at least one complete user story** by the end of the term.

Task:

- Update your team's project repo (where you put your team contract last lab) README to include **a short list of user stories** and, optionally, a short project specification — similar to what you saw in the Todo List application in Lab 4.

During Lab 4, you can ask your TA for feedback on some initial ideas for user stories that your team brainstorms during lab. We also encourage your team to post your user stories on Piazza where instructors and other members of the class can give your team feedback on the scope of your proposed user stories.

You can also use **Discuss the Scope of Your Project with an AI Tutor (https://q.utoronto.ca/courses/444184/pages/discuss-the-scope-of-your-project-with-an-ai-tutor)** to get some immediate feedback, but please ask if you still have questions after working on your project scope using the above.

Your team can always change directions early in the project, but you will need to agree on a project direction and set of user stories within the next two weeks.
